

AI-POWERED SECURITY MONITORING DASHBOARD

East Africa & Horn of Africa | Sudan · South Sudan · DRC · Somalia · Ethiopia

May 25, 2026 | v1.0

OVERVIEW

This proposal covers the design and delivery of a low-cost, AI-assisted security monitoring dashboard for five high-risk countries: Sudan, South Sudan, the Democratic Republic of Congo (DRC), Somalia, and Ethiopia. The solution provides near-real-time intelligence on terrorism, armed conflict, civil unrest, political instability, IED and drone incidents, and natural hazards — organized by country and displayed in an interactive HTML dashboard requiring no servers or specialized IT infrastructure.

THE SOLUTION

The dashboard automatically pulls from free, open-source intelligence (OSINT) sources — ACLED, GDELT, ReliefWeb, and curated regional news feeds. Claude (Anthropic’s AI) processes incoming data to classify threats, score severity, extract key locations, and write plain-language operational summaries, replacing hours of manual monitoring with an automated morning briefing.

Each country card displays:

- Latest incidents — date, location, threat type, and severity (Low / Medium / High)
- Source attribution with direct links to original reporting
- Operational implications and recommended follow-up actions
- An interactive map with color-coded incident markers

HOW CLAUDE AI IS USED

Claude is the analytical engine. It runs four automated tasks on every data refresh:

- **Threat classification** — categorizes each event (terrorism, civil unrest, natural hazard, etc.)
- **Severity scoring** — rates incidents on a 3-tier scale using event type, casualties, and geographic spread
- **Plain-language summarization** — converts raw data into concise, actionable bullets in seconds
- **Daily digest generation** — compiles overnight alerts into a structured morning briefing ready to share

Claude is accessed via Anthropic’s API. The fast, low-cost Haiku model handles high-volume classification; the Sonnet model handles complex synthesis for daily digests. No proprietary data is retained beyond each API request.

TOOLS, PLATFORMS & ESTIMATED COST

Component	Tool / Platform	Monthly Cost
AI summarization	Claude API — Haiku / Sonnet	~\$20 USD / month
Dashboard interface	Self-contained HTML + Leaflet.js	Free

Automated daily run	Local computer	Free
ESTIMATED MONTHLY TOTAL		\$20 USD / month

DEVELOPMENT TIMELINE (3 WEEKS | ~25 HOURS)

Phase	Duration	Activities
1	Week 1 (3–5 days)	Requirements, data source validation
2	Week 2 (3–5 days)	Dashboard layout, country cards, interactive map
3	Week 3 (3–4 days)	Testing, refinement, handover documentation, client walkthrough

Total cost: \$40 USD per hour * 25 = \$1000 USD

DELIVERABLES

- Interactive HTML dashboard — self-contained, opens in any browser, no server required
- Automation scripts — daily data refresh, AI summarization, and alert dispatch
- Sample daily digest — showing the morning briefing format across all five countries
- Setup & maintenance guide — so your team can run and update the dashboard independently
