

Security Intelligence Dashboard

User Guide for accessing, reading and updating the dashboard

1. How to download and open the dashboard

The dashboard is a single HTML file hosted on a GitHub repository. You do not need to install anything, sign up for any service, or use a terminal. Any modern web browser (Chrome, Safari, Edge or Firefox) is enough to open it.

Option A — Download the full repository as a ZIP

- 1 Open your web browser and go to the repository URL provided by the consultancy (for example: https://github.com/lizciat/security_dashboard).
- 2 On the main page of the repository, find the green button labelled **< > Code** near the top right of the file list.
- 3 Click **< > Code**. A small menu will open. At the bottom of that menu, click **Download ZIP**.
- 4 Your browser will download a file called something like **security_dashboard-main.zip**. Save it to a folder you can find easily, such as your Desktop or Downloads folder.
- 5 Once the download finishes, find the ZIP file and double-click it to unzip it. A new folder will appear next to it.
- 6 Open the unzipped folder, then open the sub-folder named **site**.
- 7 Inside **site** you will see a file called **index.html**. Double-click it. The dashboard will open in your default browser.

Option B — Download just the dashboard file

- 1 Open the repository in your browser as above.
- 2 Click on the folder named **site**.
- 3 Click on the file **index.html** to open its preview page.
- 4 On the preview page, look near the top right for a button with a download icon (a downward arrow) or the text **Raw**.
- 5 Right-click the **Raw** button and choose **Save Link As...** (or **Download Linked File** on Safari). Save the file as **index.html**.
- 6 Open the folder where you saved the file and double-click **index.html**. The dashboard will open in your browser.

Tip

An internet connection is needed the first time you open the dashboard, because one small library that draws the charts is loaded from a public source. After the dashboard has opened once, most parts will still work offline if you reopen the same file.

2. How to read and use the dashboard

The dashboard is organised into clear sections so you can quickly see where the highest risk is, what is driving it, and which incidents to follow up. The layout is described below in the order you will see it on screen.

2.1 Top bar — what you are looking at

At the very top you will find the dashboard title and a short summary line that tells you the date the report was generated, the total number of incidents shown, the time window covered (for example **last 3 days**) and how many sources are being monitored. This line is your quick orientation each time you open the file.

2.2 Filter bar — narrowing the view

Below the title sits a row of filters. Use them to focus on what matters to you:

- **Country** — show only incidents in one of the monitored countries.
- **Severity** — show only Critical, High or Medium incidents.
- **Type** — narrow by threat type (for example Armed Conflict, Terrorism, Drone Attack).
- **Status** — show only items you have marked as New, Verified, Escalated, etc.
- **Min. confidence** — hide low-confidence items if you want only the strongest signals.
- **Origin** — show only traditional news, only social media signals, or both.
- **From date** — start the view from a specific day.

Active filters appear as small grey chips next to the bar so you always know what is applied. Click **■ Clear** to reset everything.

2.3 Severity levels

Every incident carries one of three severity levels. The colour and the symbol are always shown together so the meaning is clear even when printing in black and white:

- **● Critical (red)** — active threat, requires immediate attention. Examples: large-scale armed clashes, mass-casualty events, drone strikes on populated areas.
- **▲ High (orange)** — serious development, monitor closely and review within 24 hours. Examples: clashes between armed groups, IED attacks, political crises.
- **■ Medium (yellow)** — relevant context. Keep on file but no immediate action required.

2.4 Country intelligence panel

On the right side of the screen you will find a list of the monitored countries. Each row shows the country flag, the number of incidents, severity counts and a small line graph showing the 14-day

trend. The arrow on the right indicates whether activity is rising, falling or stable.

Click on any country to open its detailed card. The card has several tabs:

- **Overview** — short summary, key regions affected, dominant threat types.
- **Incidents** — full list of recent incidents in that country.
- **Social** — X (Twitter) accounts being monitored, grouped by type (Press, Government, NGO, Analyst, Conflict Monitor).
- **Sources** — quick links to the news outlets used.
- **Actions** — recommended operational steps based on the threats observed.

2.5 Incident feed

The main column shows every incident as an individual card. Each card includes the country, threat type, severity badge, source, date, a short description, the region and a confidence bar. Click anywhere on the card (outside the buttons) to open a full detail window with all available information and a direct link to the original article.

Use the small buttons on each card to add the incident to your briefing, mark it as **Verified**, **Escalated** or **Archived**. These markers are stored in your browser so they remain when you reopen the same file on the same computer.

2.6 Other views

At the top of the filter bar there are three view tabs. **Timeline** is the default card feed. **Table** is a sortable spreadsheet-style view of every incident, useful when you want to scan many items quickly. **Analytics** shows summary charts: incidents by threat type, severity by country, incidents over time, and the most active sources. Every chart shows the exact numbers next to each bar.

2.7 Social media signals

Some incidents come from monitored X (Twitter) accounts rather than from news outlets. These items show the source name as a handle (for example **@martinplaut**) and represent unverified field-level information. They are useful for early warning but should always be cross-checked against a news source before being acted upon. The **Origin** filter lets you separate news and social signals when needed.

2.8 Briefing

When you click **+ Add to Brief** on an incident card, that item is added to a queue on the right side of the screen (or accessible from the **Brief** button at the top on smaller screens). Pressing **Generate Brief** creates a clean, pre-formatted intelligence summary that you can copy and paste into an email or messaging tool.

3. How to get an updated version

The dashboard is refreshed on a regular basis by the consultancy. Each new version is published to the same GitHub repository as a new file in the history folder, and the main **site/index.html** file is replaced with the latest version. You do not need to do anything special to receive updates — simply download the file again whenever you want the most recent data.

3.1 Getting the newest version

- 1 Open the repository in your browser using the same link as before.
- 2 Follow the same steps described in Section 1 (Option A or Option B) to download the file or the full ZIP.
- 3 Open the new **index.html** file in your browser. This is the most recent version of the dashboard.
- 4 You can safely delete the previous file from your computer, or move it to an archive folder if you want to keep a record of past reports.

3.2 How to identify the most recent file

The main file you open is always called **index.html** and it is always inside the **site** folder. This file is automatically replaced with the newest version each time the dashboard is regenerated, so downloading it always gives you the latest data.

Past reports are kept inside **site/runs/**. Each subfolder has a name in the format **run_YYYYMMDD_HHMMSS**, where the digits are the date and time of that report. To find the most recent past report:

- Sort the folders by name in descending order — the highest number is the most recent. For example, **run_20260615_060012** is more recent than **run_20260612_133807**.
- Inside each folder, the file named **security_dashboard_YYYYMMDD_HHMMSS.html** is the report itself.
- If you only need the latest, you do not have to look inside this folder — just use **site/index.html**.

Quick checklist

1. Open the repository link.
2. Click **< > Code** → **Download ZIP**, or open **site/index.html** and use **Raw** → **Save Link As...**
3. Unzip if needed and double-click **index.html**.
4. Use the filters and country panel to focus on what matters to you.
5. Repeat whenever you want the newest data.

If anything is unclear or the dashboard does not open as expected, please contact the consultancy team and we will assist you directly.
